

Marcaj quick-start for teams

Version 1.0 · 25 September 2026 · From the login e-mail to submitted jobs. Read with the *Annotation rules* and the *Challenge description* from the Assets.

1 · Sign in
with the login e-mail

2 · Prepare ZIPs
tiles + your model's pre-annotations

3 · Upload
all 5 parts into your draft project

4 · Publish
once — jobs are created

5 · Correct
jobs of 5 tiles, attributes, frame by frame

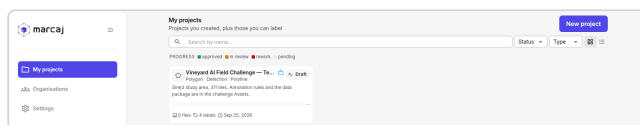

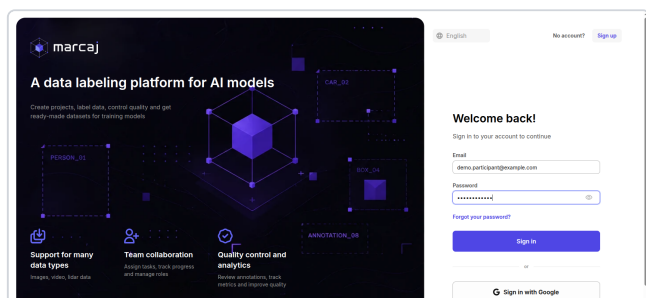

6 · Submit
every job before 15:00 Sunday

THE THREE THINGS THAT COST TEAMS THEIR SCORE

- 1. Publishing before all five tile parts are uploaded.** Pre-annotations can only be imported into an unpublished project. After publishing, the missing tiles cannot be pre-annotated any more.
- 2. Jobs left unsubmitted at the deadline.** Only submitted jobs are scored; a job still "in progress" counts as not annotated — even if every tile in it is finished.
- 3. Changing the project:** deleting or renaming tiles, editing the labels, or deleting the project. The reference is matched to your tiles by file name and to your objects by label name.

1 Sign in

On Friday evening, after team formation, every participant receives an e-mail "*Your Marcaj account*" with the sign-in address, their e-mail and a generated password. No sign-up or e-mail confirmation is needed. Check the spam folder if it does not arrive, and write to the challenge channel in Slack.

My projects shows your team's project, in **Draft** status, with the four labels already configured.

Sign in with the e-mail and the password from the letter. The interface language can be switched at any time (EN / RO / RU).

Every member of the team has the same rights in the project: anyone can upload, publish, annotate, review and export. Agree inside the team who does what — especially who publishes.

2 Prepare the upload ZIPs

Marcaj imports pre-annotations only **together with the images**, as a ZIP in the **CVAT for images 1.1** format:

INSIDE THE ZIP	WHAT IT MUST BE
annotations.xml	Your model's output: labels <code>vineyard</code> , <code>waste</code> , <code>row</code> , <code>interrow_area</code> with their attributes, exactly as in the annotation rules (Appendix A has the label block to copy).
images/siret3_r..._c....tif	The supplied tiles, unchanged and with their original names . No JPEG/PNG — they carry no georeferencing.

- One ZIP per supplied part works well: each of the five parts stays under the 90 MB upload limit.
- No model yet? Upload the five supplied parts as they are — tiles only, without `annotations.xml` — and annotate from scratch.
- The example ZIP in the Assets (`05_examples/siret3_examples_cvat.zip`) is a complete, working upload: open its `annotations.xml` to see the exact format, or upload it to a test project.

- **Put the IDs in the model output.** `vineyard_id` and `row_id` must stay the same across tile edges; assigning them over the whole orthomosaic at once, before cutting the output per tile, is far easier than fixing them by hand.

3 Upload all five parts

Open your project, and in the **Data** card choose **Upload files** →. Drop a ZIP onto the upload area or click it to choose the file.

The screenshot shows the Marcaj project interface. On the left is a sidebar with 'My projects', 'Organisations', and 'Settings'. The main area displays the project details for 'Vineyard AI Field Challenge — Team Demo'. It includes a 'Basics' section with fields for Name, Description, and Status (Draft). A 'Labeling' section shows the task type as Polygon and labels as vineyard, waste, row, and interrow_area. The 'Data' section at the bottom indicates 'No files uploaded yet' and has an 'Upload files' button.

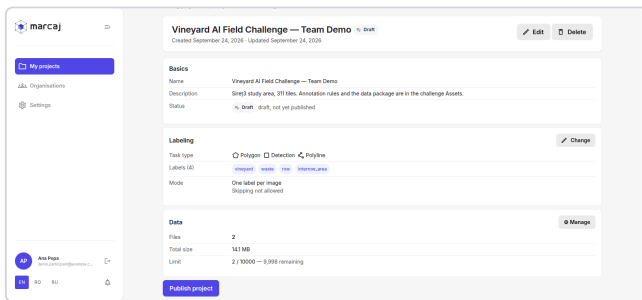

The draft project. **Upload files** → in the Data card opens the file manager. Do not use **Change** in the Labeling card or **Delete**.

The screenshot shows the Marcaj file manager interface. It displays an 'Import report' for 'Annotations imported', stating '2 frames pre-labelled, 750 objects.' and '1 class from the label dictionary were added although these frames never used them — so an annotator can still apply them.' Below the report is a dashed box for dropping files, with supported formats listed: JPEG, PNG, WEBP, GeoTIFF, or a ZIP/tar.gz archive. At the bottom, two files are shown as uploaded: 'siret3_r006_c004...' and 'siret3_r021_c012.tif'.

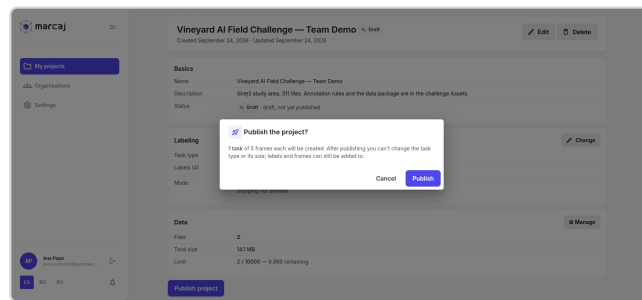

After a ZIP is processed Marcaj reports what it imported — here 2 frames and 750 objects. A note about a class "added from the label dictionary" is normal: it means a label (e.g. `waste`) had no objects in that ZIP.

- Upload the parts **one after another**; wait for each import report before the next.
- Read every report: **skipped files** or **dropped objects** mean something did not match — a renamed tile, a label or attribute name with a typo. Fix the ZIP and upload that part again. Until you publish, **Remove all** clears the files and lets you start over.
- When all parts are in, the Data card must show **311 files**.

4 Publish — once

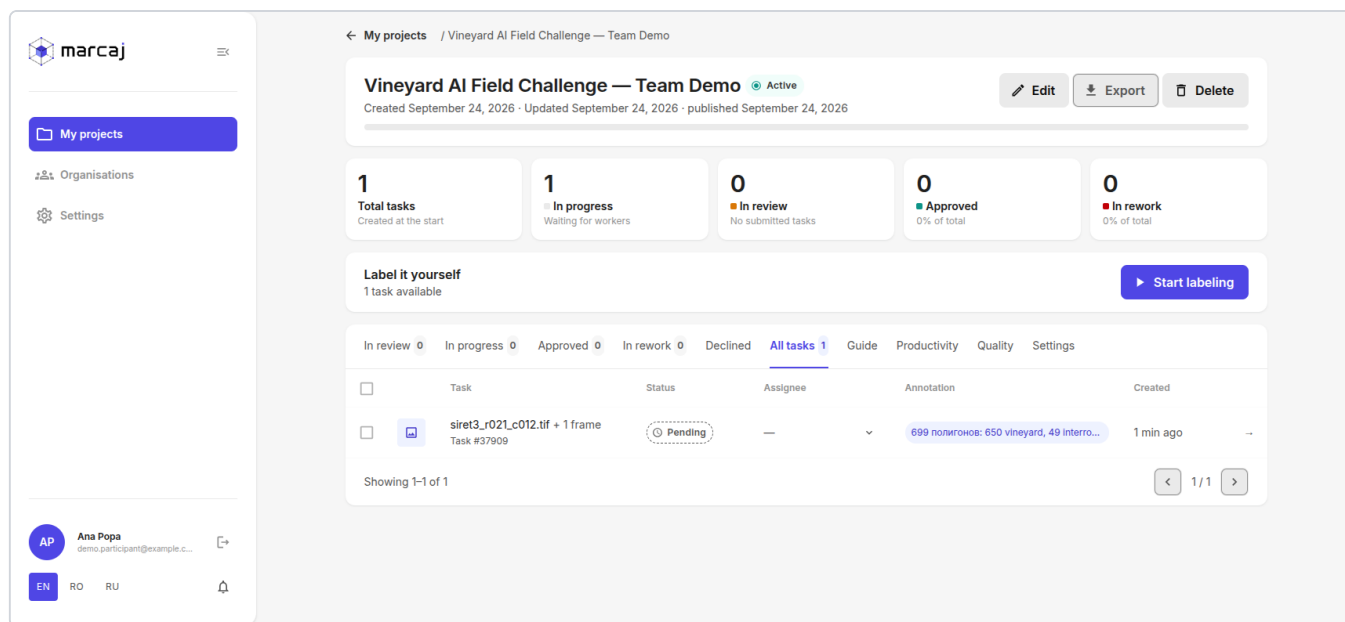

Before publishing: check **Files = 311** in the Data card.

Publish project asks for confirmation and says how many jobs it creates: 311 tiles in jobs of 5 → 63 jobs.

AFTER PUBLISHING

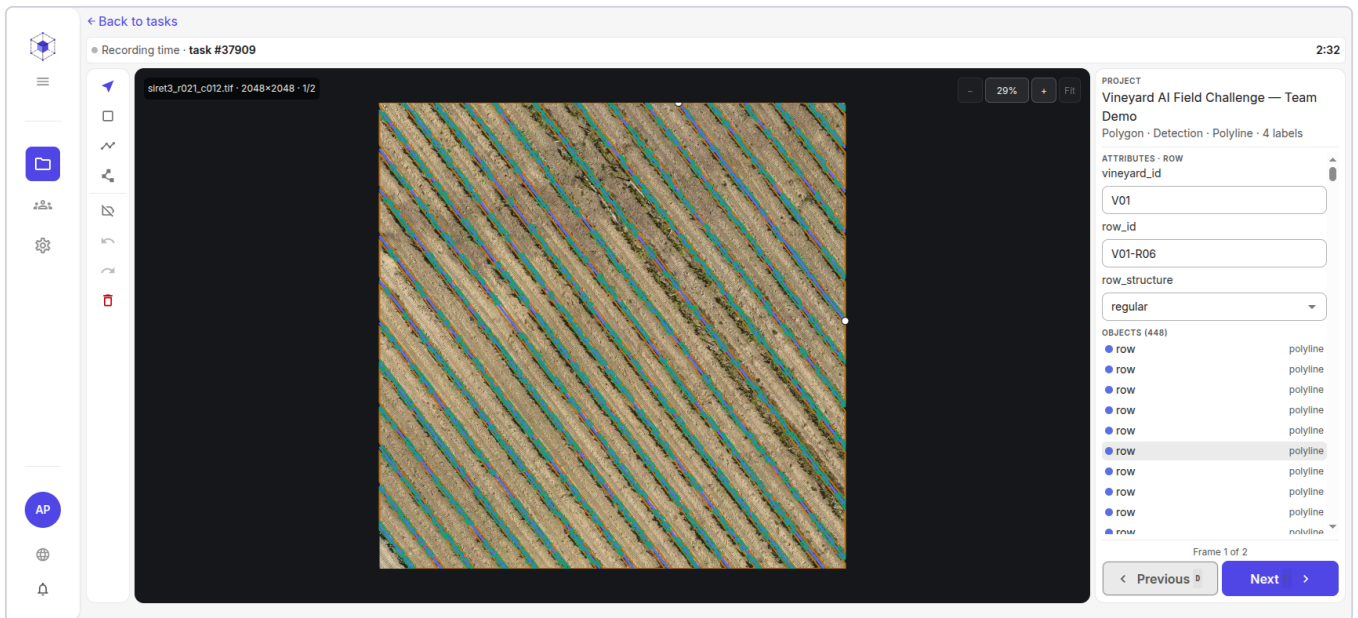

no more pre-annotations can be imported. Everything from here on is corrected by hand in the editor. Publish only when the model output is final and all 311 tiles are in.

The published project: status **Active**, task counters, **Start labeling** and the task list with the imported objects per job.

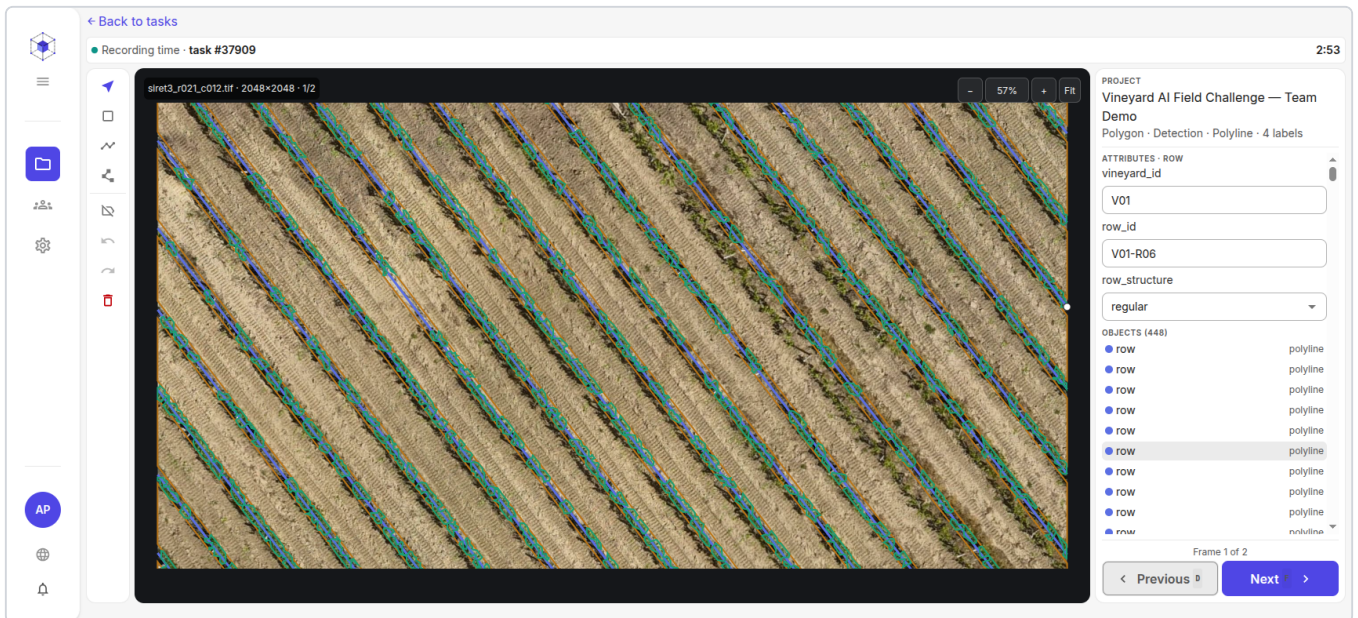

5 Correct in the editor

Start labeling hands you the next free **job of five tiles**. Each team member takes their own jobs; two people never get the same one. A job stays yours until you submit it.

The editor. Left: tools. Centre: the tile with your objects. Right: the selected object's **attributes** (here a row: `vineyard_id` V01, `row_id` V01-R06, `row_structure` regular), below them the list of all objects on the tile, and at the bottom the frame buttons.

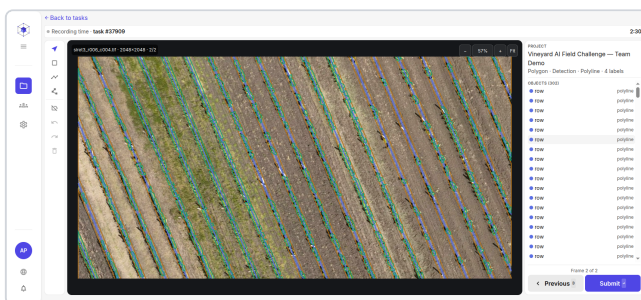

TO DO THIS	DO THIS
Select an object	Click it on the tile or in the Objects list. Its attributes appear at the top of the right panel.
Change an attribute	Type the ID in the text field, or pick the value from the drop-down (<code>row_structure</code> , <code>interrow_cover</code>).
Draw a canopy / inter-row area	Polygon P , pick the label, click the outline point by point, close on the first point.
Draw a row axis	Polyline L , click along the row, double-click to finish.
Draw a waste box	Rectangle R , drag a box around the object.
Edit a shape	Pointer V , select the object, drag its vertices.
Delete	Select, then Delete or the bin icon.
Undo / redo	Ctrl + Z / Ctrl + Y
Zoom	Mouse wheel or - / + / Fit at the top right of the tile.
Hide the label tags on the tile	The tag icon under the drawing tools — with hundreds of canopies the tags cover the image.
Previous / next tile of the job	D / F , or the buttons at the bottom right. The current tile is saved automatically when you step.
Pick a label while drawing	1 ... 9 — the label's position in the list.

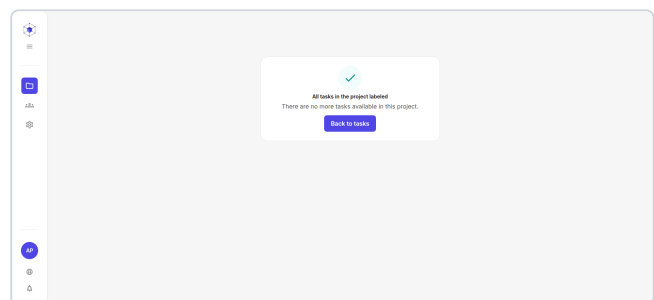

Zoomed in with the label tags hidden: canopies (green), row axes (blue), inter-row areas (orange outline).

- **A tile with nothing to annotate** (no vineyard, no waste): tick **No objects in this frame** in the right panel. A job cannot be submitted while one of its tiles has no answer.
- Keyboard shortcuts work on any keyboard layout; they do not fire while you are typing in an attribute field.

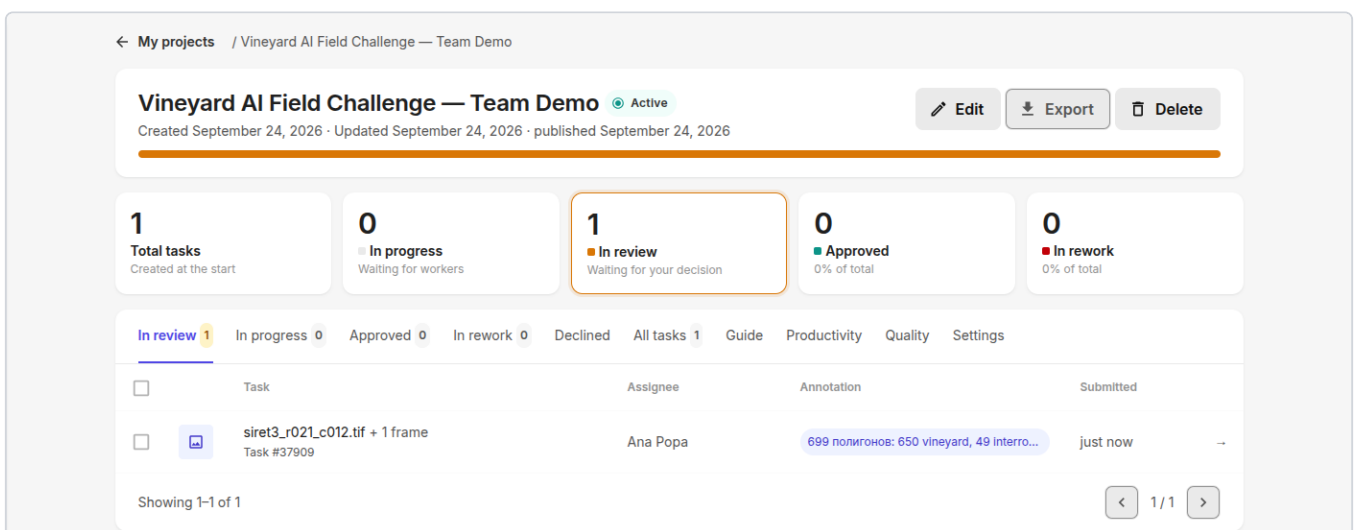

6 Submit every job

On the last tile of a job the button becomes **Submit** (Enter).

Submitted. **Start labeling** again takes the next free job; when none is left, this screen says so.

On the project page, submitted jobs are **In review**. The counters show at a glance how many jobs are still in progress.

- **Review inside the team is optional.** Anyone can open a submitted job, and approve it or send it back with remarks.
- **A job sent back is "in progress" again and is not scored until it is resubmitted.** Near the deadline, fix and resubmit rather than send back.

- **Export** downloads your annotations (e.g. *json_simple* or *CVAT XML*) — handy for computing your measurements and building the web interface. The organizers take their own export at the deadline; you do not upload one.

Before 15:00 on Sunday

- The project counters: **In progress = 0**. Every job is *In review* or *Approved*.
- No job sent back and left unresubmitted.
- The repository link is submitted (`route.geojson` , `measurements.csv` , README, code, weights).

At 15:00 the projects are frozen: editing stops, and what is submitted is what is scored.

HELP

Questions about the platform or the rules: the challenge channel in the GigaHack Slack, answered by the Marcaj team 09:00–23:00. If an import reports skipped files you cannot explain, post the report there before publishing.
